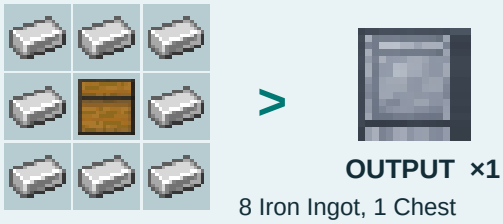
Upgraded chests

Start with a vanilla Chest. Upgrade to Iron, then Gold, Diamond and Netherite. In a Crafting Table, place the previous tier in the center and surround it with eight of the pictured material.

Place two matching chests side by side to join them. Each tier doubles its slots when paired. Use a Transfer Node on the source inventory and Transfer Pipes to route items. Try a small transfer into and out of a new chest before connecting the entire line.

Use the inventory to store tools and mixed batches. Keep a dedicated chest for the feed or output of a single machine when you need to trace where items went.

Iron Chest



OUTPUT ×1

8 Iron Ingot, 1 Chest

Gold Chest

OUTPUT ×1

8 Gold Ingot, 1 Iron Chest

Diamond Chest

OUTPUT ×1

8 Diamond, 1 Gold Chest

Netherite Chest

OUTPUT ×1

8 Netherite Ingot, 1 Diamond Chest

Slots per single / double chest

Iron 45 / 90 Gold 54 / 108 Diamond 63 / 126 Netherite 72 / 144

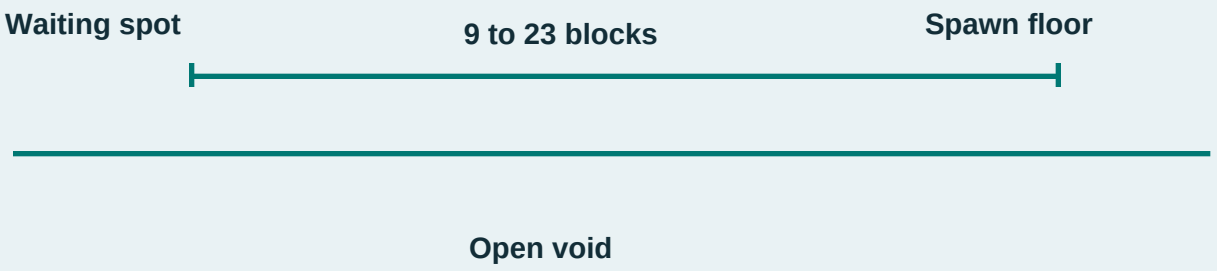
A spawning platform in the void Nether

Build a broad platform from solid, non-waterlogged blocks. Leave at least three blocks of open air above the floor and open void underneath the platform. Keep the spawning floor dark and put your waiting spot at about the same height, 9 to 23 blocks from the intended spawning area.

Enable mob spawning and use a difficulty above Peaceful. Stay in the Nether while the farm runs. The pack checks periodically, samples nearby floor positions, and limits nearby monsters. Give it time and clear existing mobs if the platform stops producing.

Possible spawns include Wither Skeletons, Blazes, Piglins, Zombified Piglins and Magma Cubes. Take the Wither Skeleton Skulls to the Wither Chamber, along with Soul Sand. A Mob Grinder facing the mobs can collect drops, including occasional skulls.

SIDE VIEW



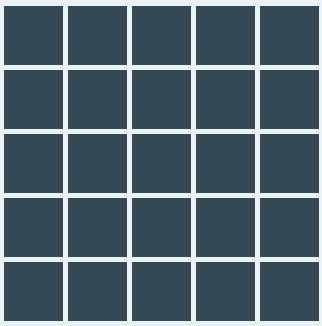
From skulls to Nether Stars

Build a sealed 5 × 5 × 5 shell around an empty 3 × 3 × 3 interior. Put one Wither Chamber Controller in an exterior wall. You can put it off-center. Use Witherproof Casing, Witherproof Glass or Chamber Ports for shell blocks, including edges and corners.

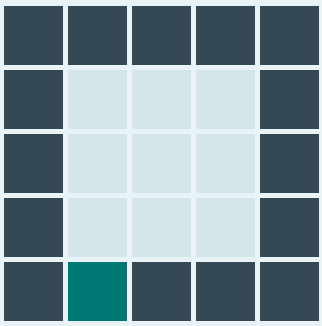
Run Watt Pipes into the shell so the Controller face stays clear. To automate, feed 3 Wither Skeleton Skulls and 4 Soul Sand through a Chamber Port. Route Nether Stars out with a Transfer Node attached to a Port. Use the Controller inventory to test the first cycle by hand.

The chamber uses a contained Wither entity and animates the assembly with Soul Sand and skulls. The explosion particles and sound are cosmetic. The chamber needs 500 W per work step at first and 800 W in the armored phase. Restore power or repair the shell if the cycle suspends. Each completed cycle makes one Nether Star.

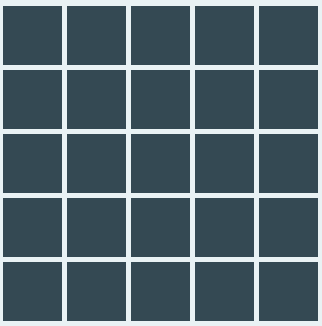
FLOOR



MIDDLE ×3



ROOF



Dark tiles show the shell. The green tile marks an example controller position. Use one controller in total. Leave the middle of all three wall layers empty.

A 5 × 5 × 5 shell uses 98 blocks in total, including the controller. Substitute glass or ports where needed.

Wither Chamber crafting recipes

Use a Crafting Table. Each card shows the recipe and its output quantity.

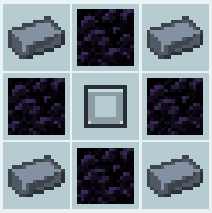
Wither Chamber Controller

>

OUTPUT ×1

2 Netherite Ingot, 2 Conductive Core, 2 Reinforced Frame, 1 Mob Grinder, 2 Advanced Circuit

Witherproof Casing

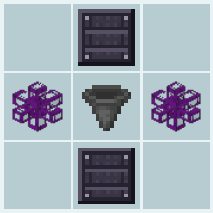


>

OUTPUT ×8

4 Steel Ingot, 4 Obsidian, 1 Reinforced Frame

Chamber Port

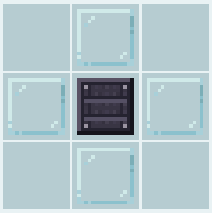


>

OUTPUT ×1

2 Witherproof Casing, 2 Transfer Pipe, 1 Hopper

Witherproof Glass



>

OUTPUT ×4

4 Glass, 1 Witherproof Casing

Star Forge and the new machine HUDs

Charge Star gear in the Star Infuser with one Nether Star and 1,600 W/s. The charge takes 10 seconds and lasts up to one Minecraft day of active use. The full charged armor set grants Resistance, Speed and Jump Boost I.

Use one eligible ore or ore product and two Nether Stars in the Star Fusion Replicator. Supply 4,000 W/s for 15 seconds to get two of the input. Diamond is supported. The Star Generator uses one Nether Star for 20 seconds at 16,000 W/s, with a 640,000 W buffer.

The red Watt Reserve gauge measures usable energy remaining on the connected supply. A green draw lamp means the machine recently drew power. A machine can keep working while the gauge looks empty if it uses power as fast as the network delivers it.

Read the work bar separately from the power gauge. Timed machines show job progress, the Harvester can show tree progress, and the Planter pulses on successful planting. Generators and machines with fuel, heat, Liquid XP or Pink Essence show those quantities on separate gauges. The Autonomous Activator is unpowered.
